Today we took learning outside! My sons and I hiked Old Robe Trail (outside of Granite Falls) and our goals were to enjoy each other's company, get some fresh air and exercise, and collect pictures of the different types of plants and rocks we saw along the way. The photos will get used over the next few days to create brochures about what we saw along Old Robe Trail. Nature and technology working together = a learning adventure!

Here are some of our photos:

Can you find the cobbles, pebbles, gravel, sand, and/or silt in these pictures? Is every type of earth matter in every picture?

Old Robe Trail used to be a railroad bed running next to the south fork of the Stillaguamish River. Due to landslides and flooding, the railroad didn't last long, but there are remnants left behind: railroad ties and spikes, pieces of metal rail, and indentations in the rock bed. There are also many different types of plants to locate and observe.
